WARRANTY

These products are of the highest quality available in the marketplace and are intended to be used in accordance with the specifications in this catalog. No information and data contained in this catalog shall be construed to create any liability on the part of Spacecraft Components Corp. Any new issue of this catalog shall automatically invalidate and supersede any and all previous issues.

A limited warranty applies to Spacecraft Components Corp. products. Except for Spacecraft Components Corp. under this warranty, Spacecraft Components Corp. shall NOT be liable for any loss, damage, cost of repairs, incidental or consequential damages of any kind, whether or not based upon express or implied warranty, contract, negligence, or strict liability arising in connection with the design, manufacture, sale, use, or repair of the products. This catalog is not to be construed as an offer. It is intended merely as an invitation to make an offer. By this publication, Spacecraft Components Corp. does not assume responsibility or any liability for any patent infringements or other rights of third parties that could result from its use.

Spacecraft Components Corp. will replace to the original purchaser any connector found to be defective in workmanship or in operation for the life of the equipment in which the component is originally and properly installed. This replacement policy is subject to the terms and conditions cited above.

PRODUCT SAFETY INFORMATION

This information should be read in conjunction with a Product Data Sheet and/or Catalog. Failure to observe the advice in this information sheet and the operating conditions specified in the Product Data Sheet and/or Catalog could result in hazardous situations.

1. MATERIAL CONTENT

Electrical connectors do not usually contain hazardous materials. They contain conducting and nonconducting materials and can be classified as follows: Rugged types with metal shells and either natural rubber, synthetic rubber, plastic or glass insulating materials. With the type of connector and/or application, contact materials vary and are usually manufactured from either: Brass, copper, alloys, nickel, alumel, chromel, constantan, iron or steel. In special applications, other materials may be specified.

2. ELECTRIC SHOCK OR FIRE HAZARDS

There is no fire hazard when a connector is correctly wired and used within the specified parameters. Incorrect wiring or assembly of the connector or careless use of metal tools, conductive fluids and/or shipping damage to any component part may cause electric shock or burns. Separating a mated connector with a live circuit could result in arcing, ionization and burning. Heat dissipation is greater at maximum resistance in a circuit. Hot spots may occur when resistance is raised locally by damage, e.g., cracked or deformed contacts, broken strands of wire. Local overheating may also result from the use of the incorrect application tools or from poor quality soldering or slack screw terminals. Overheating may occur if the ratings in the Product Data Sheet or Catalog are exceeded and can cause breakdown of insulation and hence electric shock. If heating is allowed to continue, it intensifies by further increasing the local resistance through loss of temper of spring contacts, formation of oxide film on contacts and wires, and leakage currents through carbonization of insulation and tracking paths. Fire can then result in the presence of combustible materials and this may release noxious fumes. Overheating may not be visually apparent. Burns may result from touching overheated components.

3. HANDLING

During installation and use, care must be taken to avoid damage to any component parts of the electrical connector. Normally there are no sharp edges, however, care must be taken when handling certain components to avoid injury to fingers. Electrical connectors could be damaged in transit to customers, and any damage could result in the creation of hazards. Connectors should therefore be examined prior to installation and use and rejected if found to be damaged.

4 DISPOSAL

Incineration of certain materials may release noxious and/or toxic fumes.

5. APPLICATION

Connectors with enclosed socket contacts should be selected for use on the current supply side of an electrical circuit as an electric shock could result from touching exposed pin contacts on an unmated connector. Voltages in excess of 30 VAC or 42.5 VDC are potentially hazardous. Be sure that such voltages can not be transmitted in any way to exposed metal parts of the connector body. The connector and wiring should be examined before making the circuit live, checking to see that no damage to metal parts or insulators, no solder blobs, loose strands, conducting lubricants, swarf, or any other undesired conducting particles are present. Circuit resistance and continuity check should be made to make certain there are no low resistance joints or spurious conducting paths. Do not permit untrained personnel to wire, assemble or repair connectors.

IMPORTANT GENERAL INFORMATION

1 OPERATING VOLTAGE

The permissible operating voltages depend on the individual applications and the valid national and other applicable safety regulations. As a result, the air and creepage path data are for reference values only. Observe reduction of air and creepage paths due to Printed Circuit board and/or harnessing.

2. TEMPERATURE

All information given are temperature limits. The actual operating temperature depends upon the individual application.

3. MISCELLANEOUS

Spacecraft Components Corp. continuously endeavors to improve its products. Consequently, products may deviate from the description, technical data and/or shape as shown in this catalog or respective data sheets.
